*Questioning Strategies in Marketing Research Questionnaires* Julia Glimmann 2003-03-06 Inhaltsangabe:Abstract: Questionnaires are one of the most frequently used means in marketing research. This thesis has the objective to analyze questionnaires with the main focus on the linguistic description of questions. Whereas a lot of research on questionnaires from a social science perspective and a marketing perspective can be found, linguistic research on questionnaires is rare. The research question of this thesis can be formulated as follows: What are the differences between questionnaires used in personal face-to-face interviews, telephone interviews and self-administered questionnaires and how are these differences reflected in language? Thus, several different questionnaires (cf. corpus) have been analyzed and compared. Following the introduction in chapter one, chapter two of the thesis is dedicated to marketing research. The purpose of surveys is explained as well as the sampling procedure and the pretest. This thesis focuses on primary research. Chapter three explains the symbolic interaction theory for social research. This question-answer model describes the interview situation. Chapter four is dedicated to the three different survey techniques (personal interviews, telephone interviews and self-administered questionnaires). Each of them will be discussed in detail. Chapter five deals with response effects in questionnaires and explains the influence of question words, question form, question structure and question topic on responses. Whereas chapter six focuses on the macrostructure (overall structure) of questionnaires, chapter seven focuses on the mircostructure. Question form (open-ended vs. closed questions), sentence types and sentence form will be discussed as well as wh-interrogatives and the you attitude . In chapter eight a summary of the language differences is provided for each type of questionnaire separately. Finally, in the conclusion in chapter nine, some final remarks on the topic will be made. *Traffic Flow Dynamics* Martin Treiber 2012-10-11 This textbook provides a comprehensive and instructive coverage of vehicular traffic flow dynamics and modeling. It makes this fascinating interdisciplinary topic, which to date was only documented in parts by specialized monographs, accessible to a broad readership. Numerous figures and problems with solutions help the reader to quickly understand and practice the presented concepts. This book is targeted at students of physics and traffic engineering and, more generally, also at students and professionals in computer science, mathematics, and interdisciplinary topics. It also offers material for project work in programming and simulation at college and university level. The main part, after presenting different categories of traffic data, is devoted to a mathematical description of the dynamics of traffic flow, covering macroscopic models which describe traffic in terms of density, as well as microscopic many-particle models in which each particle corresponds to a vehicle and its driver. Focus chapters on traffic instabilities and model calibration/validation present these topics in a novel and systematic way. Finally, the theoretical framework is shown at work in selected applications such as traffic-state and travel-time estimation, intelligent transportation systems, traffic operations management, and a detailed physics-based model for fuel consumption and emissions.

*Vehicle Dynamics* Dieter Schramm 2017-07-03 The authors examine in detail the fundamentals and mathematical descriptions of the dynamics of automobiles. In this context, different levels of complexity are presented, starting with basic single-track models up to complex three-dimensional multi-body models. A particular focus is on the process of establishing mathematical models based on real cars and the validation of simulation results. The methods presented are explained in detail by means of selected application scenarios. In addition to some corrections, further application examples for standard driving maneuvers have been added for the present second edition. To take account of the increased use of driving simulators, both in research, and in industrial applications, a new section on the conception, implementation and application of driving simulators has been added.
